Abstract : Five cases of hyperthyroidism, 1 grave, 2 moderate and 2 slight, were treated with 0.1 g. daily of fluorotyrosine (pardinon) for 30 days. No improvement was noted in the condition of the first patient, but the 4 less serious cases responded rapidly, with reduction in pulse rate and B.M.R., and disappearance of secondary symptoms. One of the patients suffered a recurrence of symptoms 2 months after cessation of treatment. J. N. Turner.
